2006 Annual Drinking Water Quality Report for

Westford Water Department Westford, Massachusetts DEP PWS ID # 3330000

This report is a snapshot of drinking water quality over the past year. Included are details about where your water comes from, what it contains, and how it compares to state and federal standards.

I. PUBLIC WATER SYSTEM INFORMATION

Superintendent: Warren Sweetser

Address: 60 Forge Village Road, Westford, MA 01886

Contact Person: Jessica Cajigas, Environmental Compliance Manager

Telephone #: 978-692-5529 Fax #: 978-692-5530

Internet Address:

http://www.westfordma.gov/water

Opportunities for Public Participation

Our office hours are Monday through Friday, 7am to 4pm. For emergencies after hours, please call the Police Dispatcher at 978-692-2161. If you would like to participate in discussions regarding your service or water quality issues, the Board of Water Commissioners meets at 60 Forge Village Road on the first and third Wednesday of each month at 5:30pm, unless otherwise posted. If you need to request a meeting with the commissioners about a particular issue, please submit your request in writing to Robin Fullford, Water Department Business Manager, to have your topic added to the agenda.

II. YOUR DRINKING WATER SOURCE

Water System Management and Improvements

To ensure that we provide the highest quality water available, a Massachusetts-certified operator oversees the routine operations of our system. In addition, the Massachusetts Department of Environmental Protection (MassDEP) inspects our system periodically for its technical, financial, and managerial capacity to provide safe drinking water to you. In 2006, the Westford Water Department made the following improvements to our system: 12 new hydrants, 11 new services, and 28 new gates were installed; 0.9 mile of new water main was added; and 8 water main breaks were repaired. This brings the system to a total of 900 hydrants, 5,473 accounts, 124.6 miles of water main, and total storage capacity of 4.85 million gallons. A total of 573.11 million gallons of water was pumped in 2006.

Where Does My Drinking Water Come From?

Your water source is from groundwater supplied by two major aquifers in the area, Stony Brook and Beaver Brook.

Source Name	DEP Source ID#	Location of Source	
Forge Village Well Field	3330000-01G	Forge Village Road	
Nutting Road Well	3330000-02G	Nutting Road	
Depot Road Well	3330000-03G	Depot Road	
Country Road Well	3330000-04G	Country Road	
Forge Village II Well	3330000-05G	Forge Village Road	
Howard Road Well Field	3330000-06G	Howard Road	
Cote Well	3330000-07G	Beacon Street	
Fletcher Well	3330000-08G	Concord Road	

Is My Water Treated?

We make every effort to provide you with safe and pure drinking water. To improve the quality of the water delivered to you, we treat it to remove several contaminants.

- Disinfectant is added to protect you against microbial contaminants.
- · The water is filtered to remove iron and manganese, particles, and organisms such as algae, parasites, and bacteria.
- The water is chemically treated to reduce lead and copper concentrations at your tap.
- Fluoride is added to aid in dental health and hygiene (1.01 ppm annual average in distribution system).
- The water is aerated to remove volatile organic contaminants and reduce radon concentrations.
- Ultraviolet light is used as an additional guard to protect you against pathogens.

How Are These Sources Protected?

MassDEP has prepared a Source Water Assessment and Protection (SWAP) Report, which assesses the susceptibility of public water supplies to potential contamination. The key protection issues noted for Westford include the necessity for continued monitoring of roads and other non-water supply activities in Zone I areas and working with neighboring communities to protect the Zone IIs in the water supply protection area. A Zone I is defined as the protective radius required around a public water supply well or wellfield. For public water system wells with approved yields of 100,000 gallons per day or greater, the protective radius is 400 feet. Zone II means that area of an aquifer that contributes water to a well under the most severe pumping and recharge conditions that can be realistically anticipated (180 days of pumping at approved yield, with no recharge from precipitation). Susceptibility ratings of moderate to high were assigned to the Zone II protection areas for the Town wells. The wells are located in an aquifer with a high vulnerability to contamination due to the absence of any hydrogeologic barriers (i.e. clay or bedrock), which can prevent contaminant migration. The Water Department was commended for working with the Highway Department to ensure that highway runoff is directed away from Zone IIs, acquiring land to protect the wells within Zone IIs, and working with schools to improve management of athletic field runoff. Outreach efforts are ongoing to increase public understanding of the hydrologic cycle, how pesticides and other contaminants can influence water supplies, organic lawn care, and ways residents can help protect our drinking water resources.

Where Can I See The SWAP Report?

The complete SWAP report is available on the MassDEP website, www.mass.gov/dep/water/drinking/swapreps.htm and at the Westford Water Department. For more information, contact Jessica Cajigas at 978-399-2457.

III. SUBSTANCES FOUND IN DRINKING WATER

Sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals, and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

Microbial contaminants, such as viruses and bacteria, may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife. Inorganic contaminants, such as salts and metals, can be naturally-occurring or result from urban storm water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, and farming. Pesticides and herbicides may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses. Organic chemical contaminants, such as synthetic and volatile organic chemicals, are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems. Radioactive contaminants can be naturally occurring or the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, DEP and U.S. Environmental Protection Agency (EPA) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration and Massachusetts Department of Public Health regulations establish limits for contaminants in bottled water that must provide the same protection for public health. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and some infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Centers for Disease Control and Prevention (CDC) guidelines on lowering the risk of infection by cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

IV. IMPORTANT DEFINITIONS

ppm = parts per million or milligrams per liter (mg/L)

ppb = parts per billion or micrograms per liter ($\mu g/L$)

pCi/L = picocuries per liter (a measure of radioactivity)

ND = not detected

<u>Maximum Contaminant Level (MCL)</u> – The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

<u>Maximum Contaminant Level Goal (MCLG)</u> –The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

<u>Maximum Residual Disinfectant Level (MRDL)</u> -- The highest level of a disinfectant (chlorine, chloramines, chlorine dioxide) allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

<u>Maximum Residual Disinfectant Level Goal (MRDLG)</u> -- The level of a drinking water disinfectant (chlorine, chloramines, chlorine dioxide) below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

<u>Treatment Technique (TT)</u> – A required process intended to reduce the level of a contaminant in drinking water.

<u>Action Level (AL)</u> – The concentration of a contaminant, which if exceeded, triggers treatment or other requirements that a water system must follow.

90th Percentile – Out of every 10 homes sampled, 9 were at or below this level.

<u>Massachusetts Office of Research and Standards Guideline (ORSG)</u> – The concentration of a chemical in drinking water, at or below which, adverse health effects are unlikely to occur after chronic (lifetime) exposure. If exceeded, it serves as an indicator of the potential need for further action.

<u>Unregulated Contaminants</u> – Contaminants for which EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to assist EPA in determining their occurrence in drinking water and whether future regulation is warranted.

V. WATER QUALITY TESTING RESULTS

What Does This Data Represent?

The water quality information presented in the following tables is from testing in accordance with DEP regulations for 2006. Data shown were collected during the last calendar year unless otherwise noted.

Regulated Contaminants	Date(s) Collected	Highest Detect or *Highest Quarterly RAA	Range Detected	MCL or MRDL	MCLG or MRDLG	Violation (Y/N)	Possible Source(s) of Contamination
Inorganics							
Barium (ppm)	4-12-06	0.02	0.01 - 0.02	2	2	No	Discharge from metal refineries or drilling wastes
Fluoride (ppm)	Monthly and 4-12-06	1.26	0.8 – 1.26	4**	4	No	Erosion of natural deposits; water additive which promotes strong teeth; discharge from fertilizer and aluminum factories
Nitrate (ppm)	2-1-06, 4-12-06	2.0	1.0 – 2.0	10	10	No	Runoff from fertilizer use; leaching from septic tanks; sewage; erosion of natural deposits

^{*} Highest RAA = highest running annual average of four consecutive quarters. Compliance is based on the quarterly RAAs. ** Fluoride also has a secondary contaminant level of 2 ppm.

We treat the water with fluoride. Fluoride in drinking water at levels of approximately 1 ppm reduces the number of dental cavities in both children and adults.

Disinfection Contaminants Chlorine (ppm) Monthly 0.82 0.27 – 1.6 4 4 No Water additive used to control microbes Haloacetic Acids (HAA5s) (ppb) Quarterly 30.7 8.5 – 44.7 60 No Byproduct of drinking water disinfection Total Purreduct of drinking	Regulated Contaminants	Date(s) Collected	*Highest Quarterly RAA	Range Detected	MCL or MRDL	MCLG or MRDLG	Violation (Y/N)	Possible Source(s) of Contamination	
Chlorine (ppm) Monthly 0.82 0.27 – 1.6 4 4 No control microbes Haloacetic Acids (HAA5s) (ppb) Quarterly 30.7 8.5 – 44.7 60 No Byproduct of drinking water disinfection	Disinfection Contaminants								
(HAA5s) (ppb) Quarterly 30.7 8.5 – 44.7 60 No water disinfection	Chlorine (ppm)	Monthly	0.82	0.27 – 1.6	4	4	No		
Total Brown dust of deighing		Quarterly	30.7	8.5 – 44.7	60		No	• 1	
Trihalomethanes (TTHMs) (ppb) Quarterly 65.3 20 – 95 80 No Byproduct of drinking water chlorination	Trihalomethanes	Quarterly	65.3	20 – 95	80		No	Byproduct of drinking water chlorination	

	Date(s) Collected	90 TH percentile	Action Level	MCLG	No. Sites Sampled	Sites Above Action Level	Possible Source of Contamination
Lead (ppb)	7-14-06 – 8-7-06	0.004	15	0	30	0	Corrosion of household plumbing systems; Erosion of natural deposits
Copper (ppm)	7-14-06 – 8-7-06	0.45	1.3	1.3	30	0	Corrosion of household plumbing systems; Erosion of natural deposits; Leaching from wood preservatives

Turbidity	Treatment Technique	Lowest Monthly % of Samples	Highest Detected Daily Value	Violation (Y/N)	Possible Source of Contamination
Daily Compliance (NTU)	1 0.67 No	No	Soil runoff. Turbidity has no health effects but it can interfere with		
Monthly Compliance*	0.3	98		No	disinfection and provide a medium for bacterial growth and indicate the presence of disease-causing organisms.

Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of water quality.

^{*}Monthly turbidity compliance is related to a specific treatment technique. Our system filters the water so at least 95% of our samples each month must be below the turbidity limits specified in the regulations.

Unregulated and Secondary Contaminants	Date(s) Collected	Result or Range Detected	Average Detected	SMCL	ORSG	Possible Source(s)
Chloroform (ppb)	4-12-06	3-9	6.0			Trihalomethane; byproduct of drinking water chlorination
Bromoform (ppb)	4-12-06	1-1	1			Trihalomethane; byproduct of drinking water chlorination
Bromodichloromethane (ppb)	4-12-06	5-10	7.5			Trihalomethane; byproduct of drinking water chlorination
Chlorodibromomethane (ppb)	4-12-06	6-7	6.5			Trihalomethane; byproduct of drinking water chlorination
Sodium (ppm)	2-1-06, 4-12-06	35.8 – 55.3	44.75		20	Natural sources; runoff from use as salt on roadways; by-product of treatment process
Sulfate (ppm)	2-1-06, 4-12-06	11.7 – 14.9	13.45	250		Natural sources
Iron (ppm)	2-1-06, 4-12-06	ND – 0.04	0.010	0.3		Naturally occurring, corrosion of cast iron pipes

VI. COMPLIANCE WITH DRINKING WATER REGULATIONS

Does My Drinking Water Meet Current Health Standards?

A Notice of Noncompliance (NON) & Return to Compliance was issued on July 27, 2006. This resulted from retrofitting the satellite well at Nutting Road Well with a new pump and pipe without prior approval from MassDEP. The design of the constructed facility was submitted to MassDEP for review and approval on June 28th; MassDEP inspected the constructed facility on July 20th; and approval of the facility design was issued on July 25th. This NON was not related to any health standards. We are committed to providing you with the best water quality available. We are proud to report that last year we had no violations pertaining to the quality or safety of your water.

VII. EDUCATIONAL INFORMATION

Do I Need To Be Concerned About Certain Contaminants Detected In My Water?

Sodium- Sensitive individuals, such as those experiencing hypertension, kidney failure, or congestive heart failure, should be aware of the sodium levels where exposures are being carefully controlled.

Perchlorate- In 2006, Massachusetts became the first state in the nation to promulgate drinking water standards for perchlorate, setting the standard at 2 ppb. We received final approval from MassDEP to operate a treatment system for the Cote Well in May 2006. The Cote Well had been shut down since July 2004 due to perchlorate. Since operation of the treatment system began, perchlorate has not been detected in any samples. Perchlorate may cause adverse effects on the thyroid gland. Sensitive individuals, such as women who are pregnant or nursing, infants, children under 12, or those with hypothyroidism should be aware of perchlorate levels in water and food sources that could contain perchlorate. If you have concerns about exposure to perchlorate please consult your physician.

VIII. ADDITIONAL INFORMATION

A cross-connection program is required to prevent drinking water contamination from unapproved sources. The purpose of the program is to prevent back siphoning of non-potable water (such as water from irrigation systems, sewers, drains, boilers, pools, etc.) into the public drinking water distribution system. The installation of backflow prevention devices is recommended for all inside and outside hose connections. You can purchase devices at a hardware or plumbing supply store. Cross-connection and backflow information is available at the Water Department. A cross-connection survey is done at least once a year.

Iron & Manganese Removal (oxidation and filtration)

Iron and manganese are often present in groundwater at levels that can discolor the water, or cause it to take on unpleasant odors or tastes. Iron and manganese are removed through a two-step process of oxidation and filtration. Oxidation is accomplished by adding chlorine and potassium permanganate to the water. This causes the iron and manganese to form tiny particles. Once this happens, the water passes through special filters consisting of material that is specifically designed to capture iron and manganese particles.

Primary Disinfection with MIOX (Chlorine with filtration)

All reservoirs and some ground water sources contain numerous microorganisms, some of which can cause people to become sick. To eliminate disease-carrying organisms, it is necessary to disinfect the water. Disinfection does not sterilize the water; it removes harmful organisms. The Westford Water Department uses MIOX generated sodium hypochlorite as its primary disinfectant. MIOX destroys organisms by penetrating cell walls and reacting with enzymes. When combined with proper filtration, disinfection with MIOX has been proven effective at ensuring that water is free of harmful organisms and safe to drink. Primary disinfection with MIOX is supplemented with further disinfection using calcium hypochlorite.

Corrosion Control Through pH Adjustment

Many drinking water sources in New England are naturally corrosive (i.e. they have a pH of less than 7.0). So, the water they supply has a tendency to corrode and dissolve the metal piping it flows through. This not only damages pipes but can also add harmful metals, such as lead and copper, to the water. For this reason it is beneficial to add chemicals that make the water neutral or slightly alkaline. We add potassium hydroxide to the water to adjust the water to a non-corrosive pH. Testing throughout the water system has shown that this treatment has been effective at reducing lead and copper concentrations at your tap.

Water Conservation and Protection Bylaws

The Town has a voluntary even/odd water conservation policy in effect every year from May 1 through October 31. Homeowners with even-numbered addresses may water lawns on even numbered days of the month and those with odd-numbered addresses may water on odd numbered days. The Town has also adopted water resource protection overlay districts in the Zoning Bylaws to ensure an adequate quality and quantity of drinking water for the residents, institutions, and businesses, and to preserve and protect drinking water supplies.
